**VelociCalc® Plug-In Probes**
The plug-in probes allow users to make various measurements by simply plugging in a different probe that has the features and functions best suited for a particular application.

Plug-in probes for the VelociCalc® series can be ordered at any time and include a data sheet with certificate of traceability. When it’s time for servicing, only the probe needs to be returned since all the calibration data is stored within the probe.

**Thermoanemometer Air Velocity Probes**
TSI offers four models featuring multiple measurements in a compact, robust probe design. These telescopic probes are available in straight or articulating construction, and with or without a relative humidity sensor. Models with a relative humidity sensor can also calculate wet bulb and dewpoint temperature.

Common applications include duct traversing, face velocity testing of chemical fume hoods, biological safety cabinets and HEPA filters. When combined with the 9565, advanced measurement applications can be performed including heat flow, draft rate and turbulence intensity.

**Rotating Vane Anemometer Probe**
The 4” (100 mm) rotating vane probe measures air velocity and temperature with flow calculation. Measurement applications include face velocity as well as air velocity in turbulent airstreams. An optional telescopic articulating probe and an Aircone kit are also available.

**Pitot Probes and Airflow Probe 800187**
Pitot probes are used to obtain air velocity and air volume measurements within ductwork by performing a duct traverse. Consult factory for sizes and part numbers.

The Airflow Probe Model 800187 is an 18” (46 cm) straight Pitot probe that can be used to perform duct traverses and are ideally suited for measuring in small diameter ductwork.

**LogDat2™ Downloading Software**
The VelociCalc® Model 9565 Series includes downloading software called LogDat2™. LogDat2™ software transfers the stored data from the Model 9565 to a computer as a spreadsheet file. This software is useful for applications such as duct traverses, fume hood, and filter face velocity testing.

**Data Collection and Reporting**
Expanded data logging capacity and the inclusion of TrakPro™ Data Analysis Software provides the capabilities to work more effectively and efficiently. The 9565 can store up to 38.9 days of data collected at one-minute log intervals. The stored data can be recalled, reviewed on screen, and downloaded for easy reporting. This software is useful for long term, unattended data logging applications such as IAQ and VOC investigations.

- Log multiple parameters to investigate trends.
- Store up to 38.9 days of data collected at one-minute log intervals
- User-selectable logging intervals and start/stop times
- Download data to TrakPro™ data analysis software
- Report generation
- Instrument programming

1 Pressure velocity measurements are not recommended below 1,000 ft/min (5 m/s) and are best suited to velocities over 2,000 ft/min (10.00 m/s). Range can vary depending on barometric pressure.
2 Accuracy is a function of converting pressure to velocity. Conversion accuracy improves as actual pressure values increase.
3 Overpressure range = 190 in. H2O, 48 kPa (360 mmHg).
4 Temperature compensated over an air temperature range of 40 to 150°F (5 to 65°C).
5 The accuracy statement begins at 30 ft/min through 9,999 ft/min (0.15 m/s through 50 m/s).
6 Accuracy with instrument case at 77°F (25°C), add uncertainty of 0.05°F/°F (0.03°C/°C) for change in instrument temperature.
7 Accuracy with probe at 77°F (25°C), add uncertainty of 0.1% RH/°F (0.2% RH/°C) for change in probe temperature. Includes 1% hysteresis.
8 At calibration temperature. Add uncertainty of ±0.2%/°F (0.36%/°C) for change in temperature.
9 When response factor is set to 1.00.
